

Microchip-Like, Parasite-Like, and 'Self-Assembling Nanotech' Structures Found Inside Pfizer COVID-19 Vaccine: Journal 'IJVTPR'

Researchers publish darkfield microscopy images of Pfizer jab material.

Researchers publishing in the [International Journal of Vaccine Theory, Practice, and Research](#) this month have released a study featuring darkfield microscopy images of what they describe as self-assembling “parasites,” massive ribbon-like structures, compartmentalized protocells, and a rectangular embedded structure inside Pfizer COVID-19 vaccine material, arguing that the findings are consistent with advanced synthetic biological architectures.

The publication comes as the CDC [awards](#) Pfizer more than \$1.24 billion in contracts for more COVID shots.

The new paper, “From Synthetic DNA and RNA-Based Self-Assembling Nanotechnology to Sequelae of COVID-19 Shots,” was published June 19 by independent researcher Shimon D. Yanowitz and Okinawa Christian University professor Daniel Broudy.

Abstract

Lipid nanoparticles allegedly containing synthetic “mRNA” have reportedly been injected into 5.2 billion people. Forensic study shows the general public was led to about the chemical composition, the toxicity, and the destructive power of those COVID-19 shots, which, because of remaining regulatory and institutional barriers, can only be judged by their sequelae and by forensic examination of accessible vials. Forensic study requires include: (1) contaminant effect commensurate with the size of injection such as (a) rising rates of all-cause mortality, (b) increases in spontaneous abortions and loss of fertility, (c) novel diseases, (d) “blue cloud” still being pulled from canisters by inhalation and from living persons by doctors and nurses, (e) myocarditis, heart failure, strokes, and acute neurological sequelae of many kinds; (2) synthetic entities and undischarged toxic elements have been discovered by forensic analysis and microscopy in the retrievable and cultured samples of them in rats, and in vivo in bodily fluids of living persons. Meanwhile, the intention to implant invasive synthetic technology and toxins by injection and other means to control and possibly kill people has been announced by James Glorioso, PhD, and Director of the Center for Disruptive Technologies and Future Warfare (CDTFW) at the National Defense University since January 31, 2023. In a more than 3-hour talk at West Point in 2018 and a 2020 public statement posted October 30, 2020, Glorioso speaking and writing for DARPA announced the pursuit of non-surgical computer sensing and transmitting brain interface as part of the Next Generation Nonsurgical Neurotechnology (N3) project. EE: Ian Aiyilala, PhD, and fellow of IEEE, in a 2023 YouTube focused on secretly surveilling people to the cloud for surveillance and control through injected nanotechnology. Given that advances in biotechnology standardized by IEEE since 2012 provide the means to realize the stated ambitions of Glorioso and Aiyilala, also with neuroscience mentioned by Glorioso, such as Novoblock, the COVID-19 shots have provided an opportunistic occasion to deploy and launch self-assembling nanotech entities such as the ones found in the cultured COVID-19 shots and in the bodily fluids of persons exposed to them. Also, we discuss synthetic contagion by shedding, implicitly suggested by Glorioso, along with other ways to get nanotechnology into people. After the rollout of the COVID-19 shots, emerging self-assembling entities, by disrupting cells, organs, and nation border integrity and resources are the evident cause of the catastrophic sequelae. The micron-level assembled entities can easily be seen under a field-of-view of lightfield microscope as confirmed by forensic microscopy. We raise here the urgent need for dissecting safe protocols for decontaminating and clearing out the synthetic nanotechnology to halt the contagion that is underway.

At the center of the study are microscope images derived from Pfizer vaccine-vial contents.

According to the paper, researchers placed drops of Pfizer vial material on microscope slides and observed the contents beneath coverslips.

The authors report that unusual structures appeared and organized over time after the vial material was placed under observation.

One of the first images highlighted in the paper is what the authors describe as:

“A synthetic structure, resembling a ‘parasite’ that self-assembled on a glass-slide with some fluid from a Pfizer vial placed there and located under a coverslip.”

Figure 5. A synthetic structure, resembling a “parasite” that self-assembled on a glass-slide with some fluid from a Pfizer vial placed there and located under a coverslip.

The paper also presents images of what the researchers call self-assembling ribbons.

The figure caption states:

“Very large ‘ribbon’ type structures that self-assembled on the glass-slide of the microscope from a drop of Pfizer vial matter...”

Images published in the study show long fibrous formations stretching across large portions of the microscope field.

According to the authors, some of the structures folded, frayed, and developed into increasingly elaborate forms while under observation.

Figure 6. Both a) and b) are very large “ribbon” type structures that self-assembled on the glass-slide of the microscope from a drop of Pfizer vial matter with a coverslip on top, restricting the height and causing the structures to fold over themselves.

The most visually striking image in the paper may be Figure 8.

There, the authors publish an image of what they describe as:

“A very large spherical shaped, compartmentalized, cell-sized capsule (‘protocell’)...”

Within the same image, the researchers identify:

“...a smaller rectangular compartment potentially containing meta-DNA...”

The rectangular structure appears embedded inside the larger spherical formation and is among the most unusual images presented in the study.

Figure 8. A very large (about 75 micrometers) spherical shaped, compartmentalized, cell-sized capsule (“protocell”) including a smaller rectangular compartment potentially containing meta-DNA) — encapsulated in a lipid bilayer straight from a Pfizer vial that was present beforehand or was self-assembled upon thawing of the cryogenically-frozen Pfizer liquid.

Additional images show similar spherical structures floating in Pfizer vial material.

The researchers write:

“Protocells floating in a drop of a Pfizer vial under a coverslip...”

According to the paper, these structures are not isolated anomalies.

Rather, the authors argue that the images collectively reveal a hierarchy of self-assembling architectures that begins with nanoscale material and progresses into increasingly large and complex formations visible under microscopy.

Figure 9. a) Protocells that look like CFPS cells floating in a drop of a Pfizer vial under a coverslip. Under larger magnification some cells (see b, c, d) look like teardrop-shaped CFPS cells as shown by Sacki et al. (2014), whereas a larger protocell (see e) looks different and could be an entirely different kind of protocell, as discussed later in the paper.

The researchers further argue that the structures documented in Pfizer vaccine material resemble technologies described in scientific literature involving DNA origami, programmable biomaterials, nanorobots, molecular communication systems, and synthetic biological engineering.

The paper ultimately argues that the parasite-like structures, ribbon-like formations, protocells, and rectangular embedded compartments documented in Pfizer vaccine material are components of a larger self-assembling system.

The researchers conclude that the images provide evidence linking the contents of Pfizer COVID-19 vaccine vials to broader concepts in synthetic biology, nanotechnology, and programmable biological architectures, while calling for further investigation into the identity, composition, and biological significance of the structures documented in the study.

I've followed Dr. Ana Mihalcea for years, so this is not new information for me, but it's great that this is published.

Wake up, folks.
